1. Introduction

1.1 Overview

This document contains information regarding the configuration and use of OpenVPN client with Pre-shared key.

This guide has been written for use by technically competent personnel with a good understanding of the communications technologies used in the product, and of the requirements for their specific application.

1.2 Compatibility

This application note applies to:

Models Shown: NR500 series.

Firmware Version: V1.0.0(903.0) or newer

Other Compatible Models: None

1.3 Version

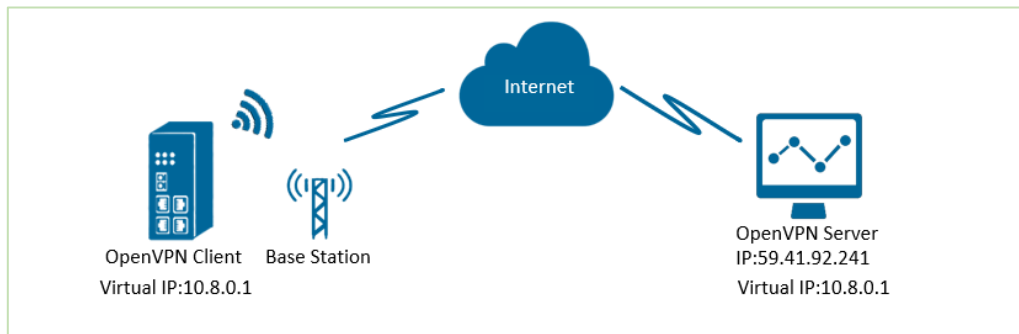

Updates between document versions are cumulative. Therefore, the latest document will include all the content of previous versions.

Release Date	Doc. Version	Firmware Version	Change Description
2018/08/03	V1.0.0	V1.0.0(903.0)	First released

1.4 Corrections

Appreciate for corrections or rectifications to this application note, and if any request for new application notes please email to: support@navigateworx.com

2. Topology

1. NR500 Pro runs as OpenVPN Client with any kind of IP, which can ping OpenVPN server IP successfully.
2. A PC runs as OpenVPN Server with a static public IP and open a specified a listening port for OpenVPN.
3. OpenVPN tunnel is established between Server and Client, the virtual IP can PING each other successfully. This is a point to point application.

3. Configuration

3.1 Server Configuration

1. Install OpenVPN software on PC and copy the related certifications and configuration to the PC like below:

Note: Kindly install and run OpenVPN software with **administrator authority**.

2. The configuration of **server.ovpn** like below:

```

=====
local 59.41.92.241
proto udp
dev tun
tun-mtu 1500
fragment 1500
ifconfig 10.8.0.1 10.8.0.2
keepalive 10 120
secret pre-shared.key
cipher BF-CBC
comp-lzo
max-clients 100
persist-key
persist-tun
status openvpn-status.log
verb 3
=====

```

3.2 Client Configuration

1. Go to **VPN>OpenVPN>OpenVPN>General Settings**, click the Edit Button and configure OpenVPN as below picture. Click Save.

OpenVPN Settings

General Settings

Index	<input type="text" value="1"/>
Enable	<input checked="" type="checkbox"/>
Description	<input type="text"/>
Mode	<input type="text" value="P2P"/>
Protocol	<input type="text" value="UDP"/>
Connection Type	<input type="text" value="TUN"/>
Server Address	<input type="text" value="59.41.92.241"/>
Server Port	<input type="text" value="1194"/>
Authentication Method	<input type="text" value="Pre-shared Key"/> ?
Encryption Type	<input type="text" value="BF-CBC"/>
Local IP Address	<input type="text" value="10.8.0.2"/>
Remote IP Address	<input type="text" value="10.8.0.1"/>
Renegotiate Interval	<input type="text" value="3600"/>
Keepalive Interval	<input type="text" value="20"/>
Keepalive Timeout	<input type="text" value="60"/>
Fragment	<input type="text" value="1500"/> ?
Output Verbosity Level	<input type="text" value="3"/>

Advanced Settings

Enable NAT	<input checked="" type="checkbox"/>
Enable HMAC Firewall	<input type="checkbox"/>
Enable Compression LZ0	<input checked="" type="checkbox"/>
Additional Configurations	<input type="text"/> ?

2. Click Save>Apply.

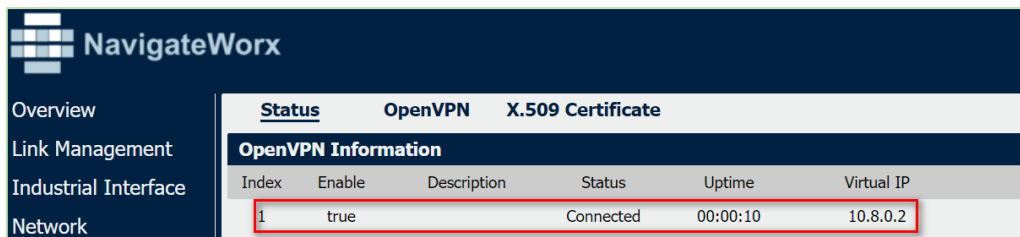

3. Go to **VPN>OpenVPN>X.509 Certificate**, to import the related certification, Click Apply.

4.Route had connected to OpenVPN server. Go to **VPN>OpenVPN>Status** to check the connection status.

The screenshot shows the 'Status' page for an OpenVPN connection. The 'OpenVPN Information' table is as follows:

Index	Enable	Description	Status	Uptime	Virtual IP
1	true		Connected	00:00:10	10.8.0.2

4. Route Table

1. Route Table on PC for reference.

```
IPv4 Route Table
=====
Active Routes:
Network Destination        Netmask          Gateway          Interface        Metric
-----
0.0.0.0                   0.0.0.0          192.168.111.1    192.168.111.19   291
0.0.0.0                   0.0.0.0          192.168.10.1     192.168.10.10    291
10.8.0.0                  255.255.255.252  On-link          10.8.0.1         291
10.8.0.1                  255.255.255.255  On-link          10.8.0.1         291
10.8.0.3                  255.255.255.255  On-link          10.8.0.1         291
127.0.0.0                 255.0.0.0        On-link          127.0.0.1        331
```

2. Route Table on Router for reference.

Route Table Information				
Index	Destination	Netmask	Gateway	Interface
1	0.0.0.0	0.0.0.0	192.168.111.1	wan
2	10.8.0.1	255.255.255.255	0.0.0.0	tun1
3	192.168.5.0	255.255.255.0	0.0.0.0	lan0
4	192.168.111.0	255.255.255.0	0.0.0.0	wan

5. Testing

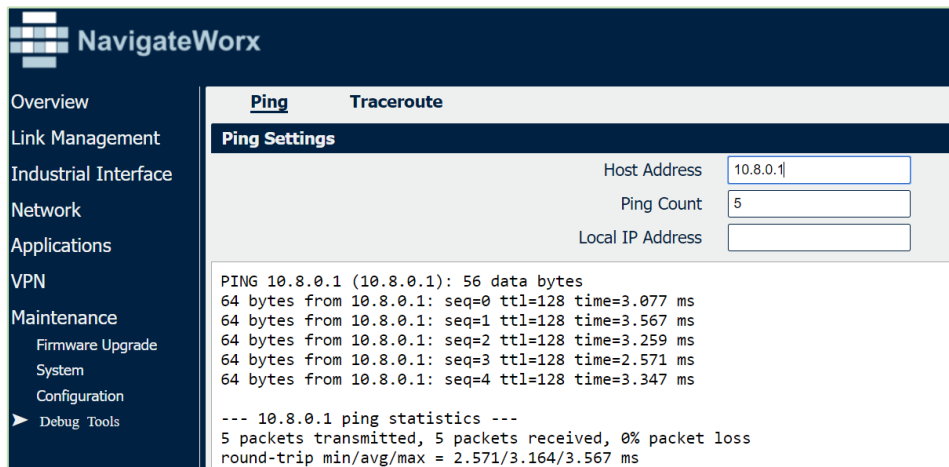

1. Enable CMD and Ping the virtual ip from PC to router.

```
C:\Users\Administrator>ping 10.8.0.2

Pinging 10.8.0.2 with 32 bytes of data:
Reply from 10.8.0.2: bytes=32 time=2ms TTL=64
Reply from 10.8.0.2: bytes=32 time=3ms TTL=64
Reply from 10.8.0.2: bytes=32 time=3ms TTL=64
Reply from 10.8.0.2: bytes=32 time=3ms TTL=64

Ping statistics for 10.8.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 2ms, Maximum = 3ms, Average = 2ms
```

2. Go to **Maintenance>Debug Tool>Ping** and Ping the virtual ip from router to PC.

The screenshot shows the NavigateWorx web interface. On the left is a navigation menu with categories: Overview, Link Management, Industrial Interface, Network, Applications, VPN, Maintenance (with sub-items: Firmware Upgrade, System, Configuration, and Debug Tools), and Debug Tools. The main content area is titled 'Ping' and 'Traceroute'. Under 'Ping Settings', there are three input fields: 'Host Address' (10.8.0.1), 'Ping Count' (5), and 'Local IP Address' (empty). Below the settings, the ping results are displayed:

```

PING 10.8.0.1 (10.8.0.1): 56 data bytes
64 bytes from 10.8.0.1: seq=0 ttl=128 time=3.077 ms
64 bytes from 10.8.0.1: seq=1 ttl=128 time=3.567 ms
64 bytes from 10.8.0.1: seq=2 ttl=128 time=3.259 ms
64 bytes from 10.8.0.1: seq=3 ttl=128 time=2.571 ms
64 bytes from 10.8.0.1: seq=4 ttl=128 time=3.347 ms

--- 10.8.0.1 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 2.571/3.164/3.567 ms

```

3. Test successfully
